

## Dynamic Assignment of Process Back to Previous Activity or Bypass Activities

Hello,

We are finding that at any given activity in our workflow, a user may need to assign a process to another activity in the workflow, i.e. jump to a previous activity or bypass processes in the workflow. Is there a simple way to do this with Joget? We thought of having a central activity that every other activity had a transition to and then transitions from that central activity back to other activities (allowing someone with access to that central activity the ability to change where the process goes next) but that seems like overkill.

Thanks!

-Pete
