

Resources

Definition

Resources is used to manage/store commonly used files meant for the App. For example, you may upload a logo/background images that will be used throughout your App.

For each resource (file) added, you may manage its permission settings. You should limit the use of the files to within your own App as a good practise.

Figure 2: Properties & Export - Resources - Add Resource

Add Resource allows you to upload a file to be added into the App.

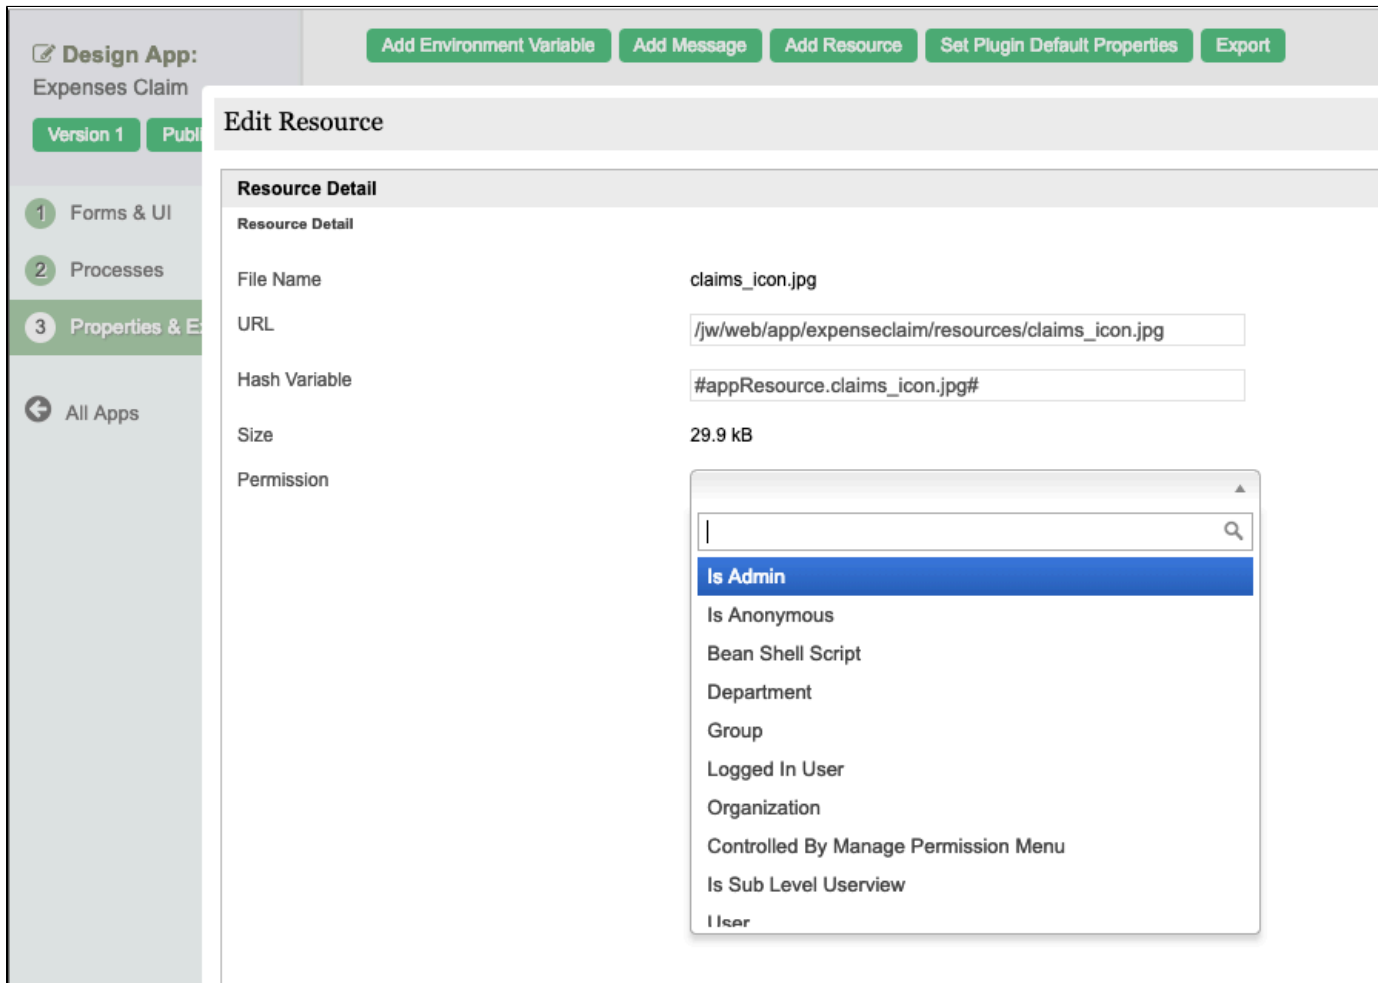

Figure 2: Properties & Export - Resources - Edit Resource

Edit Resource allows you to manage the individual resource file. You may obtain the relative URL to access the file or make use of the hash variable given within the scope of the App for convenience. The hash variable would resolve into a relative URL same as the "URL" given.

The access of the file can be managed through "Permission" attribute.
