

Protect Sensitive Data

Protecting Form Fields in Joget

Joget now allows the form fields in the application designer to be protected. It allows our users to protect sensitive data such as SSN, Password, etc. This will ensure that the submitted data will be protected.

By default, the password field is encrypted and looks as follows in the database (%%ENCRYPTED_VALUE%%)

A text field can also be made a protected field. Open Form Builder and Edit the "Text Field" you want to encrypt. Check the Encryption check box.

The image shows a 'Property Editor' dialog box with a title bar containing '[close]'. The main content area is titled 'Edit Text Field' and has a breadcrumb path: 'Edit Text Field > Choose Validator > Workflow Variables'. The following properties are listed:

- ID * (text input: SSN)
- Label * (text input: SSN)
- Value (text input: empty)
- Max Length (text input: empty)
- Size (text input: empty)
- Readonly (checkbox: unchecked)
- Display field as Label when readonly? (checkbox: unchecked)
- Encryption (checkbox: checked, highlighted with a yellow border)

At the bottom, there are navigation buttons: '< Prev', 'Next >', 'OK', and 'Cancel'.
