

Counter Increment Tool (Enterprise)

Counter Increment Tool is used to increase a [workflow variable](#) or an [environment variable](#) within a workflow. This can be handy for activities such as loops. To use this tool correctly you will need to place it within a loop in your workflow (a transition out of the tool, and later a transition that passes back into the tool).

The screenshot shows a web-based configuration interface for the 'Counter Increment Tool'. The interface has a light gray header with the text 'Plugin Configuration'. Below this is a white box with a gray border and a title bar that says 'Configure Counter Increment Tool'. Inside this box, there are five configuration fields, each with a red asterisk indicating it is required: 'Type' is a dropdown menu currently set to 'Workflow Variable'; 'Variable Name' is an empty text input field; 'Initial Counter Value' is an empty text input field; 'Increment Value' is a text input field containing the number '1'; and 'Reset value when value exceed' is an empty text input field. At the bottom right of the white box is a 'Submit' button.

Figure 1: Counter Increment Tool Plugin Configuration

The following configuration options are available:

- **Type** - Select 'Workflow Variable' or 'Environment Variable'. You can increment either type using this tool.
- **Variable Name** - Enter the name of the workflow variable or environment variable that you wish to increment.
- **Initial Counter Value** - Enter the value that the variable should initially be set to. Note: If the variable already has a value when this tool is executed for the first time, that value will be overwritten.
- **Increment Value** - The amount that will be added to the variable each time this tool is called in your workflow.
- **Reset when value exceeded** - Optionally enter a threshold value after which the counter will be reset to the 'Initial Counter Value'.
