

## Pre-populate Form Select List from External Source

To pre-populate a single form select list from an external source, choose the select field and click on 'Edit'.

### Parent Information

Add Section Add Column Edit Section Delete Section

Drag This Column

First Name *	<input type="text"/>	Edit Column
Last Name *	<input type="text"/>	
Email address *	<input type="text"/>	
Relationship Category *	Mom <input type="button" value="▼"/>	<input type="button" value="Edit"/> <input type="button" value="Delete"/>

Under the 'Choose Options Binder' menu, click on 'Bean Shell Form Binder' in the Options Binder select field.

### Property Editor

[close]

#### Choose Options Binder

Edit Select Box > **Choose Options Binder** > Configure Bean Shell Form Binder > Choose Validator > Configure Validator > Workflow Variables

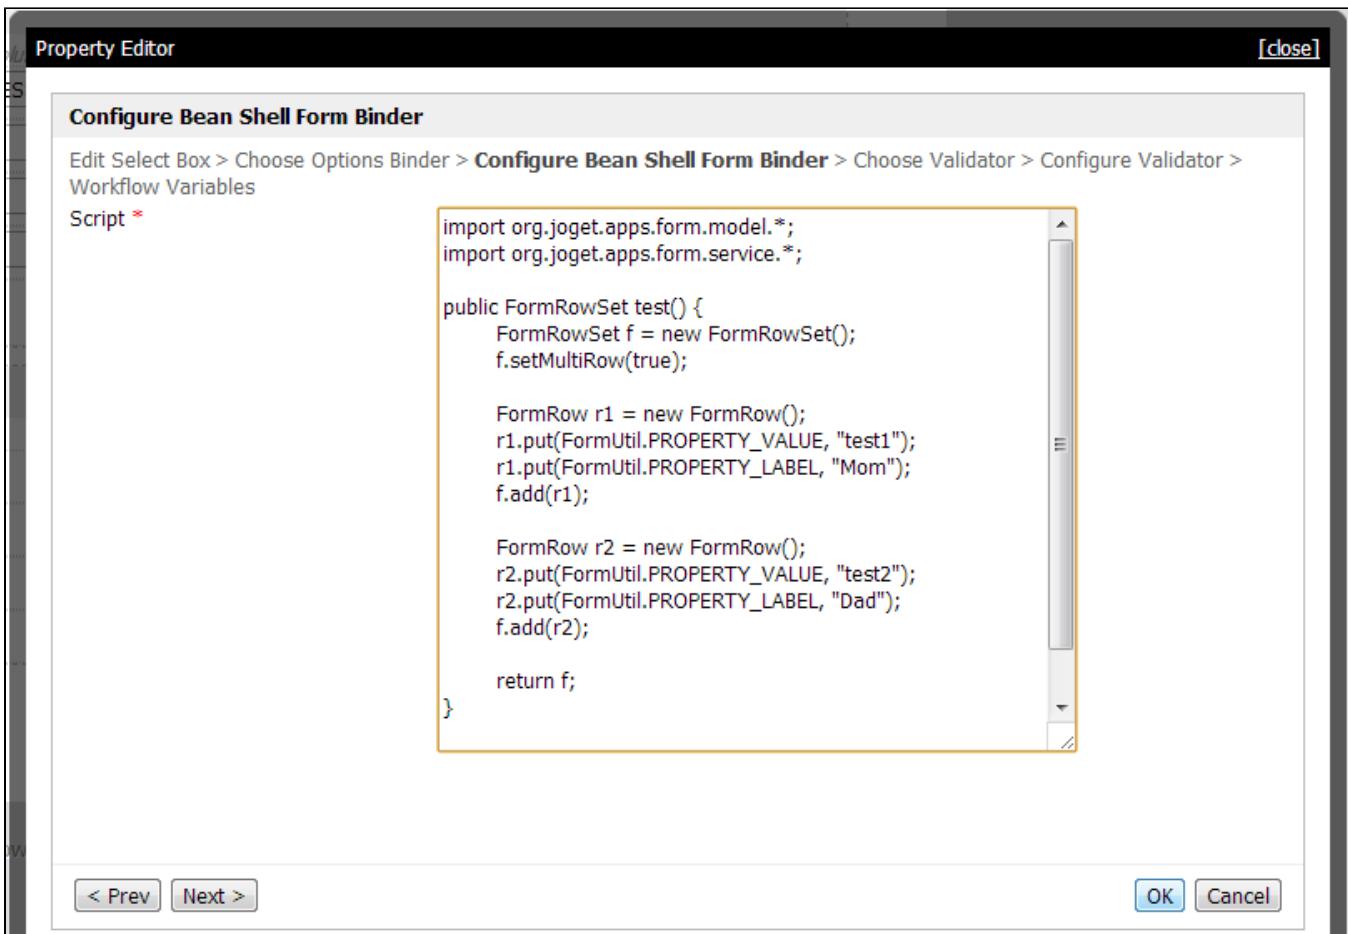

Options Binder

Bean Shell Form Binder

Bean Shell Form Binder  
Default Form Options Binder

< Prev Next > OK Cancel

Under 'Configure Bean Shell Form Binder', enter your Bean shell script to populate the select fields. For each row that you add to the FormRowSet, be sure to put the 'FormUtil.PROPERTY\_VALUE' and 'FormUtil.PROPERTY\_LABEL' fields in the FormRow that will be added to the FormRowSet.

```
import org.joget.apps.form.model.*;
import org.joget.apps.form.service.*;

public FormRowSet test() {
FormRowSet f = new FormRowSet();
f.setMultiRow(true);

FormRow r1 = new FormRow();
r1.put(FormUtil.PROPERTY_VALUE, "test1");
r1.put(FormUtil.PROPERTY_LABEL, "tester1");
f.add(r1);

FormRow r2 = new FormRow();
r2.put(FormUtil.PROPERTY_VALUE, "test2");
r2.put(FormUtil.PROPERTY_LABEL, "tester2");
f.add(r2);

return f;
}

return test();
```

Of course, you would want to populate the values for PROPERTY\_LABEL and PROPERTY\_VALUE from your external datasource. For more information on how to connect to a database source, see the example code within '[Pre-populate Form Fields with Data from External Source](#)' or [Bean Shell Form Binder for Options Binder](#).
