

Resizing Datalist Column to Accommodate Large Number of Columns

In Datalist with many columns, the width set at individual columns may get suppressed when there are too many columns added. In order to improve the viewing experience, we can try to make use of the CSS and Javascript code below.

In your useview builder's settings, add the CSS.

```
Custom CSS

body .dataList th, body .dataList td {
  display: inline-block;
}

.dataList table {
  width: max-content !important;
}
```

And in Custom Javascript, add in the code below.

```
Custom Javascript

$(function(){
  var n = 1;
  $("tbody > tr:first > td").each(function(){
    var width = $(this).css("width");

    //make column header the same width as first data row
    $("thead > tr > th:nth-child(" + n + ")").css("width", width);

    //make other data column the same width as first data row
    $("tbody > tr > td:nth-child(" + n + ")").css("width", width);

    n++;
  });
});
```
