

Selectbox Grouping Dependency Based on Parent Form Field

By using the code below, we would be able to use the parent form field value in grid form as a grouping/dependency for a dropdown selectbox.

Custom HTML Code In Child Form

```
<script>
$(function(){
    region = window.top.$("input[name='region']:checked").val();
    FormUtil.getField("region").val(region);
});
</script>
```

The screenshot shows a web application interface with a dark blue header and a grey sidebar. The main content area is titled "DROP DOWN DEPENDENCY IN GRID". Below the header, there is a breadcrumb trail: "Home > Manage Parent".

The "Parent" form section contains a "Region" field with four radio buttons: Africa, Asia (selected), Oceania, Americas, and Europe. Below this, there is a "Child Data" section with a "Country" field and a green plus icon. At the bottom of the parent form are "Save" and "Cancel" buttons.

A modal window titled "Child" is open, showing a "Name" field and a "Select Box Example" dropdown menu. The dropdown menu is open, displaying a list of countries: Afghanistan, Armenia, Azerbaijan, Bahrain, Bangladesh, Bhutan, Brunei Darussalam, Cambodia, China, and Georgia. A blue arrow points from the "Asia" radio button in the parent form to the dropdown menu in the child form.

With the script above, it will copy the parent form field value from the parent form into the child form. This way, we can now make use of "Field ID to control available options based on Grouping" attribute in the Select Box. This way, we will be able to limit the selections when populating the selections through the JSON Call Form Options Binder in bid to improve performance and narrow down the selections.
