## Sending Email

In your process design, you may include a Tool element and map it to the Email Tool.

Configure email server settings in the Plugin Configuration dialog box.

| & Export | Plugin Configuration               |  |  |  |  |  |
|----------|------------------------------------|--|--|--|--|--|
|          | Configure Email Tool               |  |  |  |  |  |
|          | Configure Email Tool > Email       |  |  |  |  |  |
|          | SMTP Host * smtp.mail.com          |  |  |  |  |  |
|          | SMTP Port * 2525                   |  |  |  |  |  |
|          | Does the SMTP need authentication? |  |  |  |  |  |
|          | SMTP Username admin                |  |  |  |  |  |
|          | SMTP Password •••••                |  |  |  |  |  |
|          |                                    |  |  |  |  |  |

## Figure 1: Email Setting

In the  $\ensuremath{\textit{Email}}$  tab, customize the content of the email.

| Email                        |                                     |  |  |  |  |
|------------------------------|-------------------------------------|--|--|--|--|
| Configure Email Tool > Email |                                     |  |  |  |  |
| From *                       | info@domain.com                     |  |  |  |  |
| To (specific email address)  |                                     |  |  |  |  |
| To (participant ID)          | requester                           |  |  |  |  |
| сс                           |                                     |  |  |  |  |
| Subject                      | Application Approved                |  |  |  |  |
| Message                      | Hi #requester.firstName#,           |  |  |  |  |
|                              | Your application has been Approved. |  |  |  |  |

Figure 2: Customizing the Email Content

You may make use of hash variables in your email message to gain access to useful information such as requester's details, form data, etc.

| Attachments                                |          |                    |           |    |  |  |  |  |
|--------------------------------------------|----------|--------------------|-----------|----|--|--|--|--|
| Configure Email Tool > Email > Attachments |          |                    |           |    |  |  |  |  |
| Form                                       | ▼        |                    |           |    |  |  |  |  |
| Form Upload Fields                         | Field ID |                    |           |    |  |  |  |  |
|                                            |          | 0 0 <mark>0</mark> |           |    |  |  |  |  |
|                                            | •        |                    |           |    |  |  |  |  |
| Files                                      | Path     | Туре               | File Name | ]  |  |  |  |  |
|                                            |          | System Path 💌      |           | 00 |  |  |  |  |
|                                            | •        |                    |           | _  |  |  |  |  |
|                                            |          |                    |           |    |  |  |  |  |
|                                            |          |                    |           |    |  |  |  |  |
|                                            |          |                    |           |    |  |  |  |  |
|                                            |          |                    |           |    |  |  |  |  |
|                                            |          |                    |           |    |  |  |  |  |
| < Prev Next >                              |          |                    |           |    |  |  |  |  |

## Figure 3: Including File Attachments

You can also include file attachments in the email by looking up the files uploaded in a form or by providing a system path or URL for external files.

Note: If you want to setup a task notification for new tasks, please see User Notifications.

## Verifying SMTP Server Connectivity

You will need to check with the server administrator on permission for connection/port for the SMTP server. A quick way to check connectivity to the server is to execute the following command:

telnet mail.sampleDomain.com 25 Connecting To mail.sampleDomain.com...

Upon successful connection, you will see this message:

+OK Microsoft Exchange Server 2001 POP3 server version 1.2.3.4 (sampleDomain.local) ready.
