

# Protect Sensitive Data

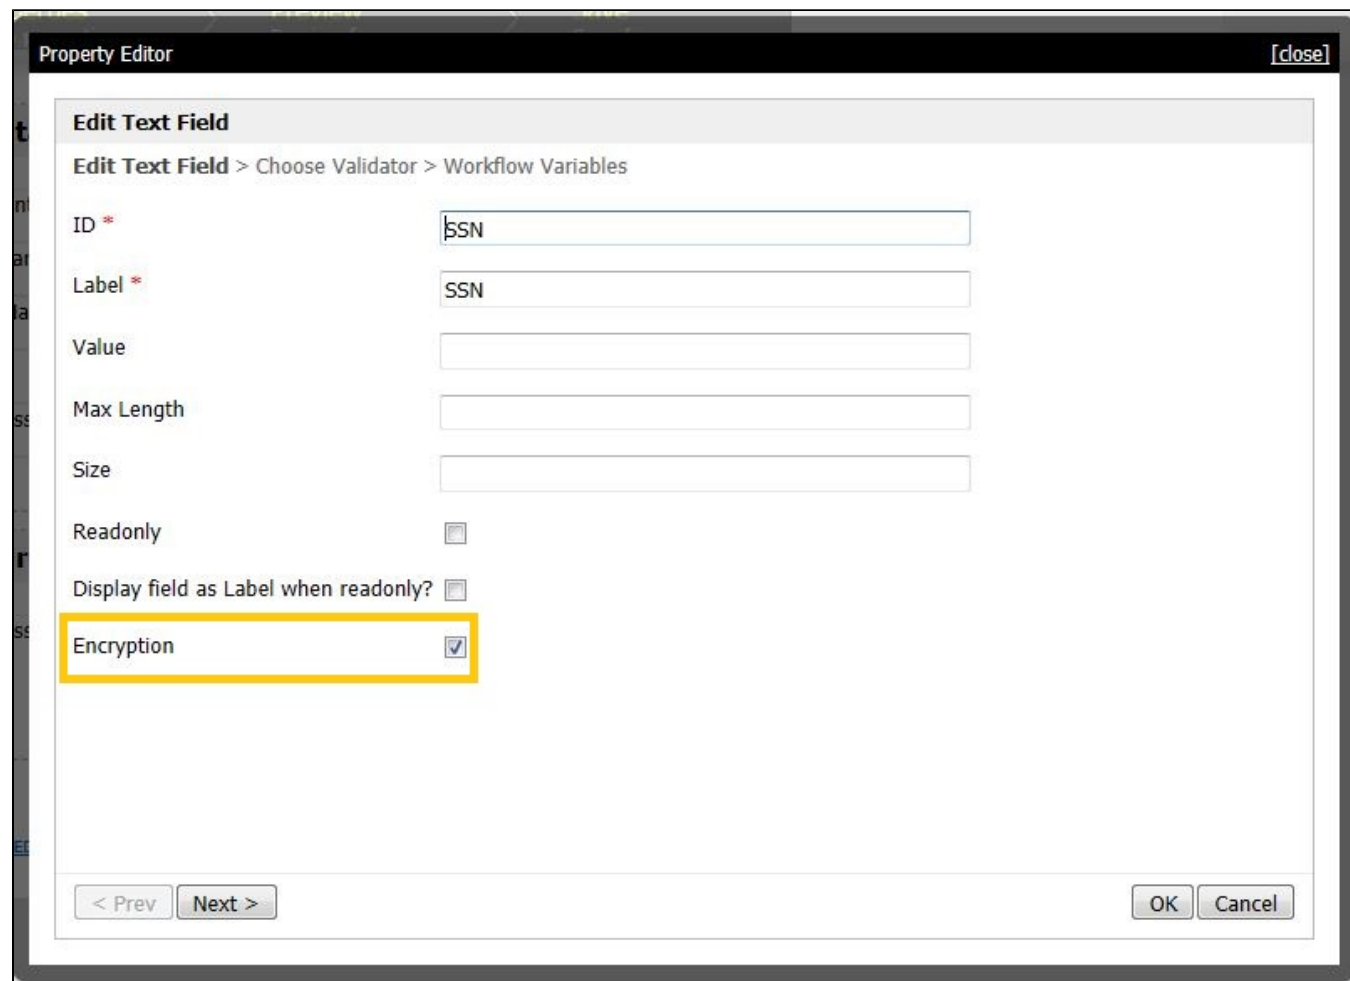

## Protecting Form Fields in Joget

Joget now allows the form fields in the application designer to be protected. It allows our users to protect sensitive data such as SSN, Password, etc. This will ensure that the submitted data will be protected.

By default, the password field is encrypted and looks as follows in the database (%%ENCRYPTED\_VALUE%%)

A text field can also be made a protected field.

Open Form Builder and Edit the "Text Field" you want to encrypt. Check the Encryption check box.

The screenshot shows the 'Property Editor' dialog box with the title 'Edit Text Field'. The breadcrumb path is 'Edit Text Field > Choose Validator > Workflow Variables'. The form has several fields: 'ID' with a red asterisk and a text input containing 'SSN'; 'Label' with a red asterisk and a text input containing 'SSN'; 'Value' with an empty text input; 'Max Length' with an empty text input; 'Size' with an empty text input; 'Readonly' with an unchecked checkbox; 'Display field as Label when readonly?' with an unchecked checkbox; and 'Encryption' with a checked checkbox, which is highlighted by a yellow rectangle. At the bottom, there are navigation buttons '< Prev' and 'Next >', and 'OK' and 'Cancel' buttons.
