Running Activity Instance

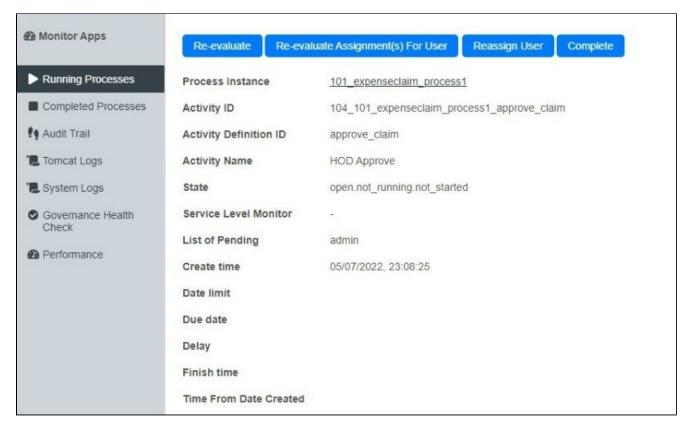

Figure 1: Viewing a Running Activity Instance

In this view, one can see the state and statistical data of a particular activity instance. One can also inspect and set workflow variable values for the activity instance.

Actions that the administrator can perform on the process instance:

- **Re-evaluate**
  Re-evaluate the participant mapping for the current activity instance.
- **Re-evaluate assignment(s) for user**
  Re-evaluate all assignments of a particular user.
- **Reassign user**
  Reassign one of the assignee(s) of this activity instance to another user.
- **Complete**
  Complete the activity instance as the current logged in user.

Activity State

When a new activity instance is created, the state will be set to **open.not_running.not_started**. In natural progression, the state will end with the state of **closed.completed**.

If the activity has a deadline triggered, the state will change to **closed.terminated**. If the process instance is aborted, then, the activity instance's state will change to **closed.aborted**.
