

List Data Store

- [Introduction](#)
- [List of List Data Stores](#)

Introduction

The **List Data Store** determines the source of data and returns the data set required for the List Builder to create a listing of records. The List Datastore itself is a type of plugin that one may extend and creates a new one.

The [Form Data List Data Store](#) is the default choice in populating the data set from the form data submitted using the Form Builder.
