

# HostManager

- Description
- Code Sample
- Methods
  - `getContextPath`
  - `getCurrentHost`
  - `getCurrentProfile`
  - `isVirtualHostEnabled`
  - `setCurrentProfile`
  - `setCurrentHost`

## Description

- `org.joget.commons.util.HostManager`
- Under wflow-commons module
- Utility methods used by the system to manage cloud profile

## Code Sample

```
import org.joget.commons.util.HostManager;

String profileName = HostManager.getCurrentProfile();
```

## Methods

`getContextPath`

```
public static java.lang.String getContextPath()
```

Gets the context path of the HTTP request

`getCurrentHost`

```
public static java.lang.String getCurrentHost()
```

Gets the current Host of HTTP request

`getCurrentProfile`

```
public static java.lang.String getCurrentProfile()
```

Gets the current cloud profile of HTTP request

`isVirtualHostEnabled`

```
public static boolean isVirtualHostEnabled()
```

Flag to indicate it is a Cloud installation

`setCurrentProfile`

```
public static void setCurrentProfile(java.lang.String profile)
```

Sets the profile of current HTTP request.

This method is security protected in Cloud installation.

`setCurrentHost`

```
public static void setCurrentHost(java.lang.String hostname)
```

Sets the Host of current HTTP request.

This method is security protected in Cloud installation.
