

Multi Paged Form

Multi Paged Form enables one to incorporate **multiple forms in one single form**, in a simple and elegant way.

Notable Improvement over Joget Workflow v4

1. Detailed validation errors retained when switching to the tab with validation errors.
2. Mobile version support is added in Joget Workflow v5.

Figure 3: Multi Paged Form Properties - Page

Name	Description
Label	Page name displayed in the form of breadcrumb or tab, depending on its setting in the UI
Form	Target Form
Readonly?	Determines if the page is editable
Parent Form Field to keep Child Form ID	ID of the field in the parent form to store the page's primary key. Page data will be loaded based on the record ID retrieved from this field.
Child Form Field to keep Parent Form ID	ID of the field in the page form to store the parent form's primary key
Validate when change page	Performs validation on page change if checked

Important Note about Parent Form Field to keep Child Form ID

This field must be specified if the individual form is not storing into the same table as the parent form.

Field specified does not need to be first created in the parent form.
