Bean Shell Form Binder

Definition
Bean Shell Form Binder allows you to dictate how Form Data should be loaded and stored.

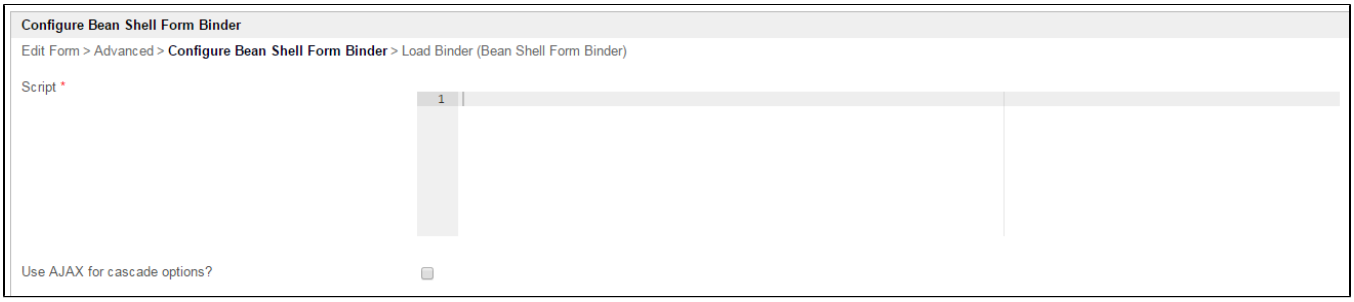

Figure 1: Bean Shell Form Binder Properties

Name	Description

Script	Script in Java. See Bean Shell Programming Guide for example.
	
	Quick Example
	
	Sample Load Binder that will populate field with id "description" with the value "hello world".
	
	 	
	`import org.joget.apps.form.model.*;`
	
	`FormRowSet f = new FormRowSet();`
	`FormRow r1 = new FormRow();`
	`r1.put("description", "hello world");`
	`f.add(r1);`
	
	`return f;`

Use AJAX for cascade options?	When checked, this allows these fields to **dynamically** load available **options** based on the other field value (grouping column) when dealing with tremendous amount of selections. Read more at Ajax Cascading Drop-Down List. Not applicable for Form Binder. Only available when used as an Options Binder.
