Generate App

Definition
App Generator allows you to generate lists, CRUD (Create-Read-Update-Delete), processes directly from a form. You can create new plugin of this type to serve as templates for typical design needs to accelerate app development process further. You may run the same generator more than once.

Quick Note

You must first save the form (to commit to the server) before utilizing this function so that the server can generate using the latest form design that you have.

Choosing multiple generators

You can choose more than 1 generator at the same time and then click on the generate button. Each checked generator will run one after another.

List of generators

- Generate CRUD
- Generate Datalist
- Generate Process - Approval Process
- Generate Process - Assignment Process
