

# Setting Workflow Variable Value in Process Tool Bean Shell

This is probably the most commonly asked question of all time.

It only takes a couple of lines of code to set the value into a workflow variable:

```
import org.joget.workflow.model.service.*;

WorkflowManager wm = (WorkflowManager) pluginManager.getBean("workflowManager");
wm.activityVariable(workflowAssignment.getActivityId(),"status", "Approved");
```

The Joget Marketplace has a free plugin called the [Workflow Variable Update Process Tool](#) . This is a process tool to easily update any number of workflow variables in your process. With this tool, you now do not need to use a BeanShell script.
