

Advanced Participant Mapping

Advanced Participant Mapping Through the Use of Workflow Variables

Advanced participant mapping through the use of workflow variables allows one to assign tasks dynamically during process runtime. The workflow variable may consist of the following:

- Group code
- Username
- Department code
- Head of Department (Department code)

Joget supports multiple assignments through the use of semicolon delimited value, but only one type is supported at a time.

For example, you may use the workflow variable "technician" to represent **Username**, with the following value passed in:

jack;david;clark
