Form Builder Properties

### Edit Form

Figure 1: Edit Form Properties

Name	Description
ID	Form ID.
Name	Form name.
Table Name	Database table name. Maximum name is 20 characters. Joget will prefix "app_fd_" to the table name to create the actual table in database. For example, if you table name is "expense", the actual database table name is "app_fd_expense".
Description	Description of what the form intends to do. This is meant for developer/admin consumption only to describe the purpose of this element.

### Advanced

Figure 2: Advanced Properties

Name	Description
Load Binder	The Load Binder is responsible to populate the form data. By default, Workflow Form Binder is the default binder used to return data from submitted forms.
Store Binder	The Store Binder is responsible to store the form data. By default, Workflow Form Binder is the default binder used to store data from submitted forms. ⓘ Under normal circumstances, the Load and Store binder should be the same to maintain the same source for the data to be written to/read from.
Permission	Manage the permission on who to see this section. See Permission Control.
Unauthorized Message	Message to be shown when permission is defined.

Post Form Submission Processing

Execute a tool after a form is submitted. Only applicable for primary form, in form grid, and list grid.
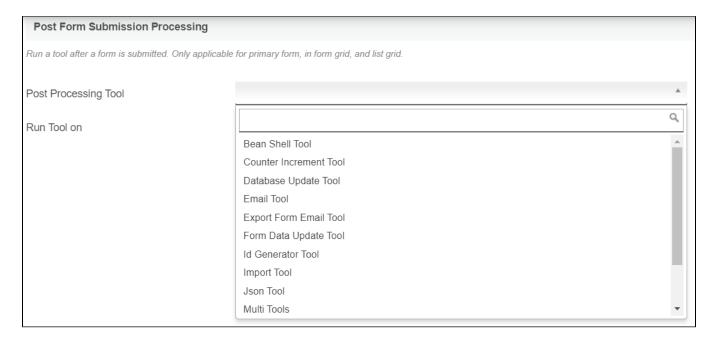

Figure 3: Post Processing Properties

Name	Description
Post Processing Tool	Select a tool to execute based on the event below. See Map Tools to Plugins for the list of plugins.
Run Tool on	- Data creation - Data update - Both date creation and update
