

Add Extra Attributes and Signature to User Profile

In this sample app, we are exploring how to create a Joget App to store user-specific information. By creating a Joget App, we are able to further add more attributes meant to be part of the user profile.

For example, we can create a form with a hidden field set to current logged in user's ID so that the logged in user can self-service and update its details.

How to access and use signature

For example, to include admin's signature inside Email Tool, use the following tag.

```

```

This is how it looks like.

In order to show the user's signature, we can use the hash variable stated on the screen.
