

Create Userview Theme

[Watch the video tutorial on Creating Your Own Userview Theme.](#)

This section will show you how to create a userview theme. Before proceeding, make sure that you have completed [Building from Source](#).

- [Create New Maven Project](#)
- [Create a New Userview Theme File](#)
- [Copy Resources From Existing Themes](#)
- [Customize Your Theme](#)
- [Activate Your Theme](#)
- [Build and Upload the Plugin](#)

Create New Maven Project

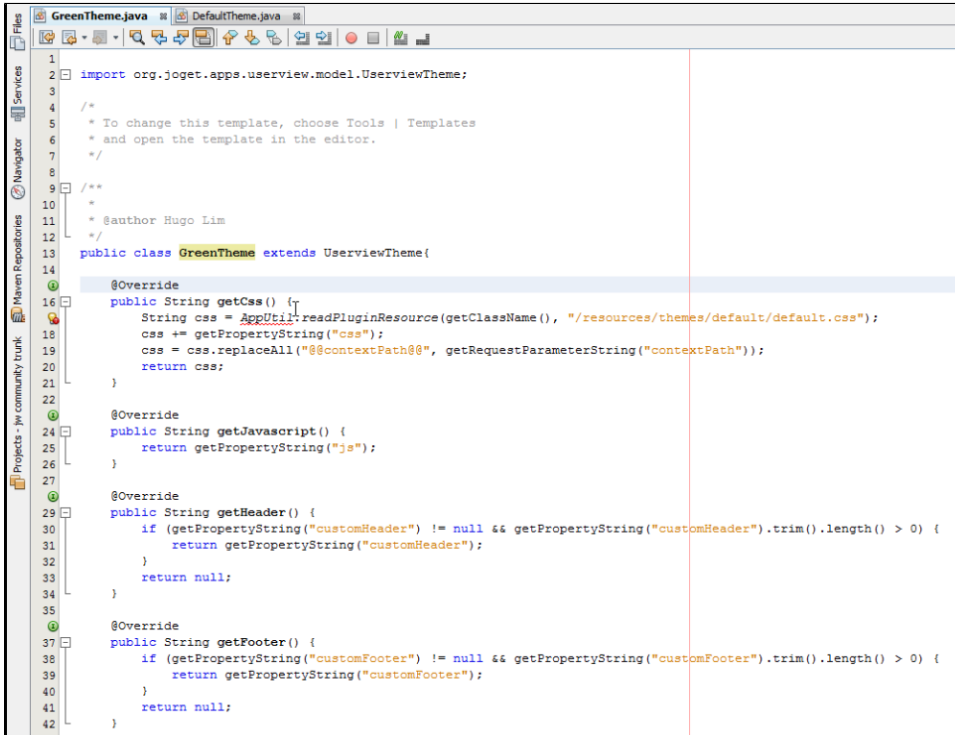

1. Download [wflow-plugin-archetype.zip](#).
2. Create a new project using the following instructions:

```
D:\sample>"D:\wflow-plugin-archetype\create-plugin.bat" org.joget.sample sample-plugin-pack
[INFO] Scanning for projects...
[INFO] Searching repository for plugin with prefix: 'archetype'.
[INFO] Building Maven Default Project
[INFO] task-segment: [archetype:generate] (aggregator-style)
[INFO] Preparing archetype:generate
[INFO] No goals needed for project - skipping
[INFO] archetype:generate (execution: default-cli)
[INFO] Generating project in Interactive mode
[WARNING] Archetype not found in any catalog. Falling back to central repository (http://repo1.maven.org/maven2/org/joget/wflow-plugin-archetype/3.0-SNAPSHOT: checking for updates from wflow-plugin-archetype
[INFO] snapshot org.joget:wflow-plugin-archetype:3.0-SNAPSHOT: checking for updates from wflow-plugin-archetype
[INFO] Using property: groupId = org.joget.sample
[INFO] Using property: artifactId = sample-plugin-pack
Define value for property 'version': 1.0-SNAPSHOT: 3.0-SNAPSHOT_
```

3. When you are ready, open your project in your Netbeans.

Create a New Userview Theme File

1. Create a new Java file to be used for the userview theme.

```
1
2 import org.joget.apps.userview.model.UserviewTheme;
3
4 /*
5  * To change this template, choose Tools | Templates
6  * and open the template in the editor.
7  */
8
9 /**
10  *
11  * @author Hugo Lim
12  */
13 public class GreenTheme extends UserviewTheme{
14
15     @Override
16     public String getCss() {
17         String css = AppUtil.readPluginResource(getClassName(), "/resources/themes/default/default.css");
18         css += getPropertyString("css");
19         css = css.replaceAll("@@contextPath@", getRequestParamString("contextPath"));
20         return css;
21     }
22
23     @Override
24     public String getJavaScript() {
25         return getPropertyString("js");
26     }
27
28     @Override
29     public String getHeader() {
30         if (getPropertyString("customHeader") != null && getPropertyString("customHeader").trim().length() > 0) {
31             return getPropertyString("customHeader");
32         }
33         return null;
34     }
35
36     @Override
37     public String getFooter() {
38         if (getPropertyString("customFooter") != null && getPropertyString("customFooter").trim().length() > 0) {
39             return getPropertyString("customFooter");
40         }
41         return null;
42     }
43 }
```

2. You may copy implementation codes from the existing Default Theme in the wflow-core project.

Copy Resources From Existing Themes

1. Create your theme files in "src/main/resources/themes/green".
2. Copy the properties definition file from "wflow-core/src/main/resources/properties/userview/defaultTheme.json".

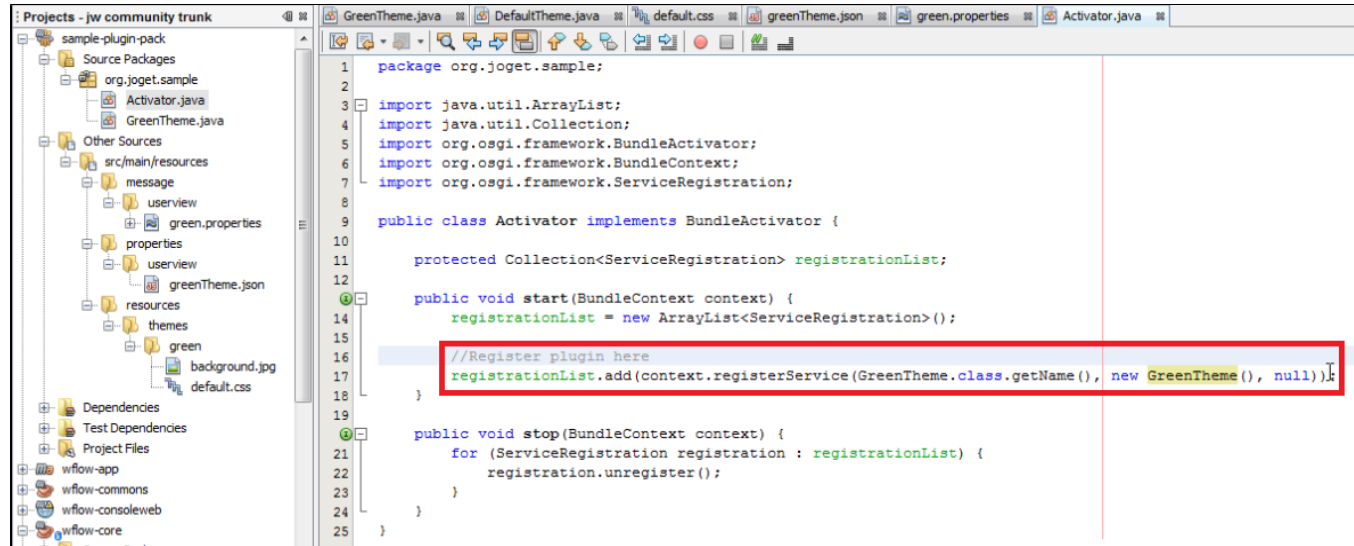

3. Copy the message file from "wflow-consoleweb/src/main/resources/message/userview".

Customize Your Theme

Make the necessary changes in naming in order to reflect your new theme.

Activate Your Theme

In Activator.java, add the newly created userview theme class to the BundleActivator activation list.

Build and Upload the Plugin

When you are ready, build and upload the plugin to the **Manage Plugins** section of "System Settings" in your Joget console.
